# Dark matter

## mass and distribution by directional detection

---

based on arXiv:1707.05523;

KN, R. Yakabe (Kobe Univ.), T. Naka (Nagoya Univ., Toho Univ.), K. Miuchi (Kobe Univ.)

work in progress

KN, T. Ikeda (Kobe Univ.), R. Yakabe, T. Naka, K. Miuchi

# Outline

1. Introduction
2. Anisotropy of velocity distribution
3. Numerical Results
4. Summary

# Dark Matter

- Stable
- Electrically neutral, weakly interacting
- Non-relativistic
- Weakly Interacting Massive Particles (WIMPs)
- Axions
- Primordial black holes
- Modified Gravity
- .....

# Detection

- direct detections
- indirect detections
- search at colliders

# Direct Detection

- Detect recoil energy of DM-target scattering

## Underground facilities (a partial list)

It has been proven that underground facilities are very important for varieties of science!  
For scientific reasons, It would be very nice if there is (at least) one in the Southern hemisphere...

# Constraint from Direct Detection

$$R \propto N_T N_\chi f(\vec{v}) \langle v \rangle \sigma$$

$$\frac{dR}{dE_R} = \frac{N_T \rho_0}{m_\chi} \int^{v_{\max}} d\vec{v} f(\vec{v}) |\vec{v}| \frac{d\sigma(\vec{v})}{dE_R}$$

$R$  Event rate

$N_T$  # of target particles

$N_\chi = \frac{\rho_0}{m_\chi}$  # of WIMP

$f(\vec{v})$  Velocity distribution

$\langle v \rangle$  Averaged WIMP velocity

$\sigma$  Cross section for  
DM-nucleus scattering

# Constraint from Direct Detection (cont.)

# Big Problem in direct detection

Environmental BG radiation

Neutrons

$\beta$

WIMPs

Discrimination

- ❑ Kamioka
- ❑ Otoh
- ❑ Soudan (USA)
- ❑ Gran Sasso (Italy)
- ❑ Jinping (China)

# A Solution -Directional Detection-

- detect not only the recoil energy but also direction where DM comes from.

# Advantages

- Powerful BG rejection  
BG : isotropic(?)  
DM signal : from the Cygnus

DM wind

- Neutrino Floor
- Test DAMA ... Motivation

# Directional Searches

# Outline

1. Introduction
2. Anisotropy of velocity distribution
3. Numerical Results
4. Summary

# Standard velocity distribution

## ■ Maxwell-Boltzmann (MB) distribution

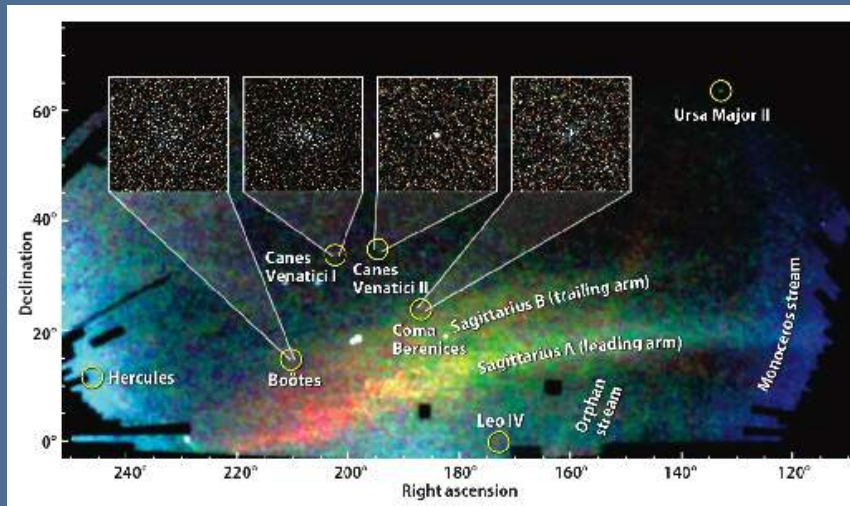

$$f(v) = \frac{1}{(\pi v_0^2)^{3/2}} e^{-(v+v_E)^2/v_0^2}$$

$$\frac{dR}{dE_R} = \frac{N_T \rho_0}{m_\chi} \int^{v_{\max}} d\vec{v} \, f(\vec{v}) |\vec{v}| \frac{d\sigma(\vec{v})}{dE_R}$$

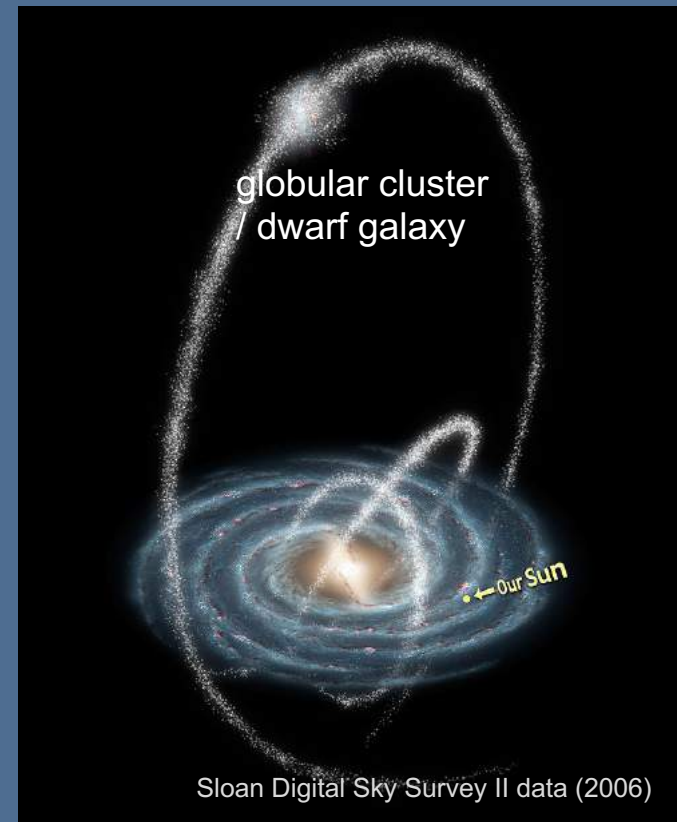

- isotropic MB distribution is commonly supposed in direct detections

# May not be so simple

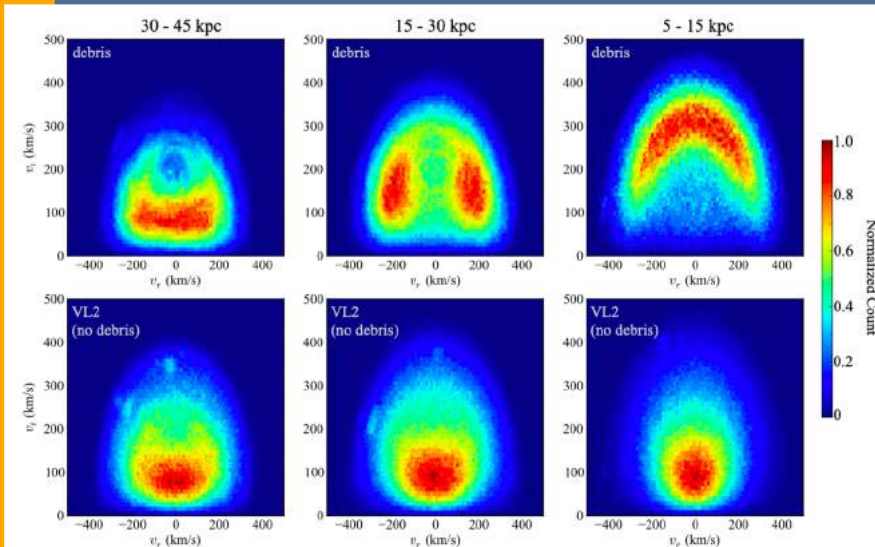

A stellar stream is torn apart and stretched out along its orbit by tidal forces, and flow into a galaxy.

# Debris Flow

- Some N-body simulations suggest anisotropy

Lisanti and Spergel (2011)

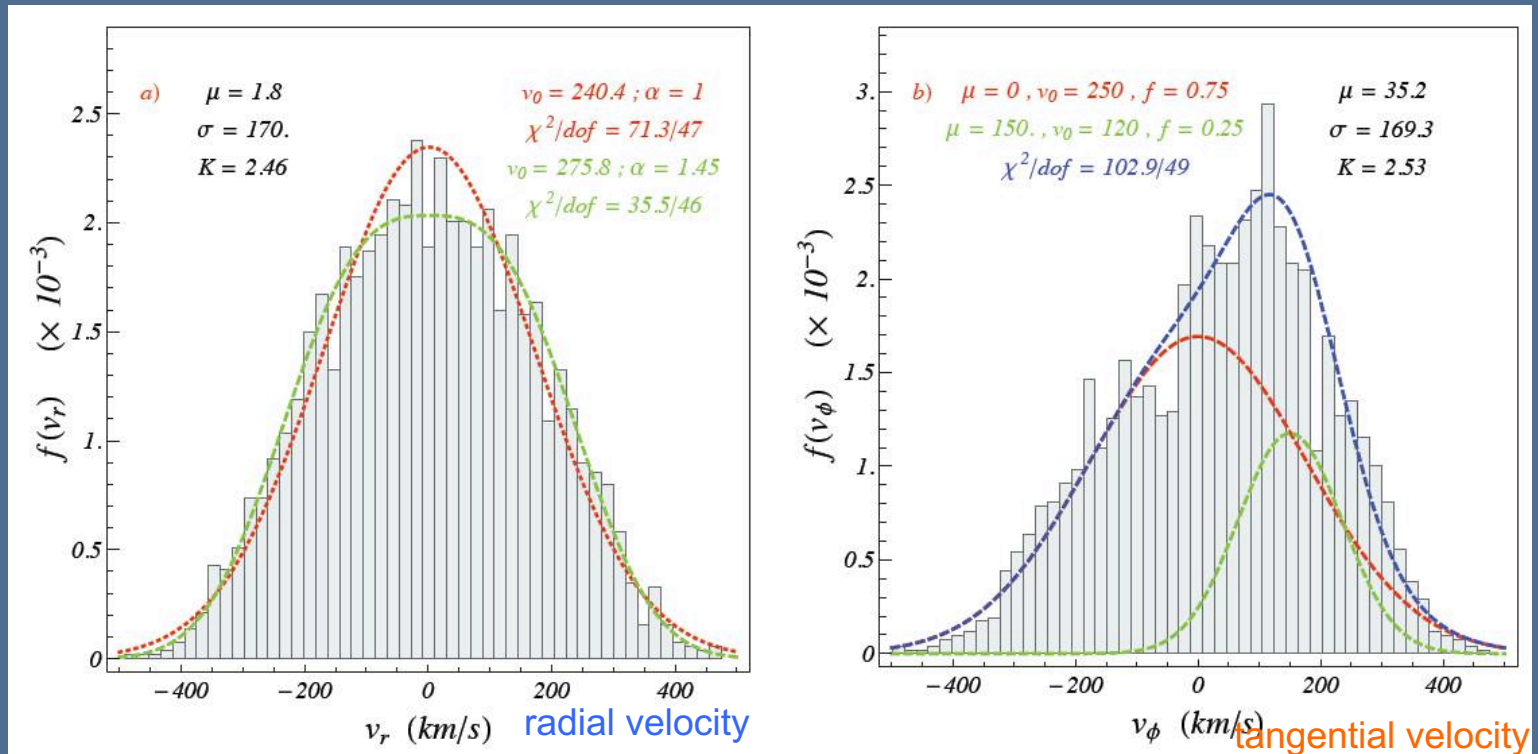

# Simulation including baryons and gas

the Galaxy

the Solar system

Ling, Nezri, Athanassoula & Teyssier (2009)  
cf. David R. Law (2009) ...

# Anisotropic component

$$f(v_\phi) = \underbrace{\frac{1-r}{N(v_{0,\text{iso.}})} \exp[-v^2/v_{0,\text{iso.}}^2]}_{\text{isotropic}} + \underbrace{\frac{r}{N(v_{0,\text{ani.}})} \exp[-(v-\mu)^2/v_{0,\text{ani.}}^2]}_{\text{anisotropic}}$$

- Tangential velocity
  - anisotropy parameter  $r$
  - $r=0.25$  is suggested by simulation

# Simplified Goal

OR

(AND  $M_{\text{DM}}$ )

# Outline

1. Introduction
2. Anisotropy of velocity distribution
3. Numerical Results
4. Summary

Ben Morgan, Anne M. Green, Neil J. C. Spooner (2004)  
Ole Host, Steen H Hansen (2007)

# Numerical Simulation of Scattering

DM wind  $f(v)$

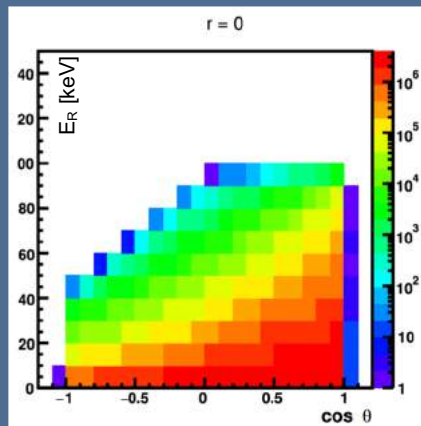

- Monte Carlo simulation of scattering **supposing  $f(v)$** 
  - $E_R$  and  $\theta$  are obtained
  - Elastic scattering, No BG, Perfect resolution
  - Target : F (light) /Ag (heavy)

# Analysis

- depends on resolutions of a detector

Energy resolution :OK  
Angular resolution :OK

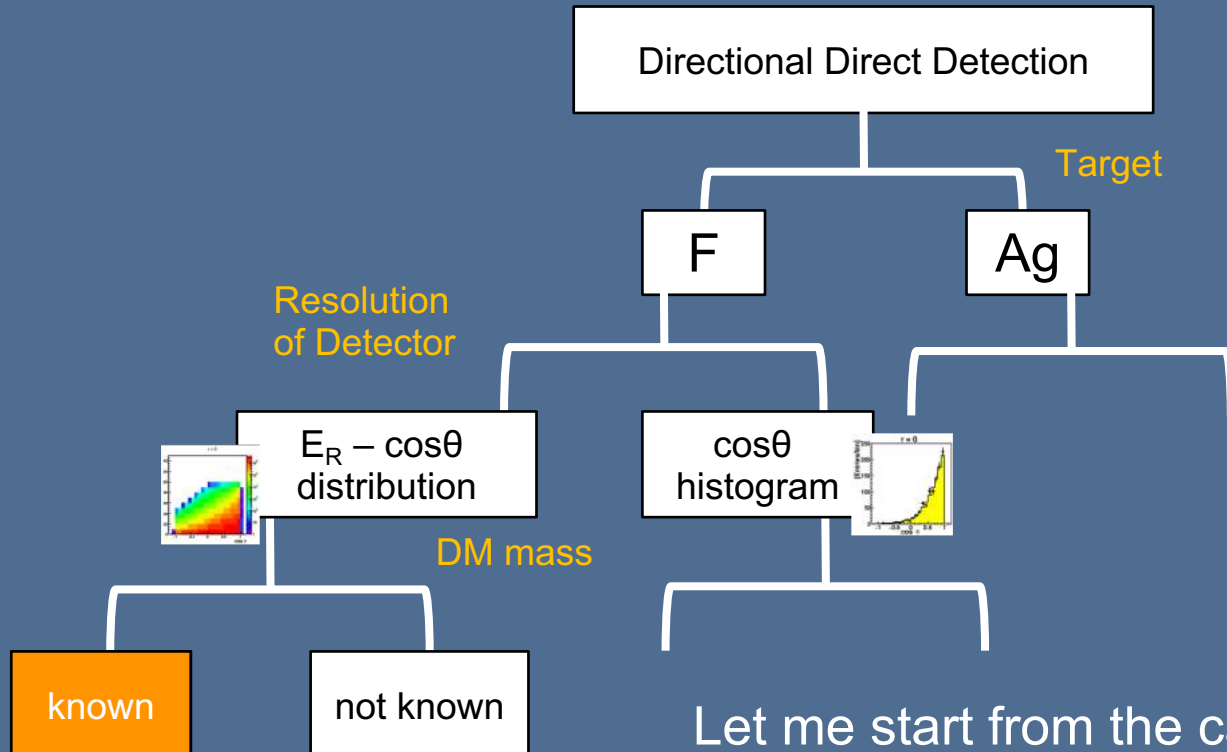

$E_R$ - $\cos \theta$   
energy-angular distribution

Energy resolution :NG  
Angular resolution :OK

$\cos \theta$   
angular histogram

## Summary of Branches

Let me start from the case that  $M_{\text{DM}}$  is known by collider search:

e.g.  $M_{\text{DM}} \sim 3M_A$

i.e. 60GeV (F) / 300GeV (Ag)

# Strategy for discrimination

ideal **“template”**  
Many Data  
(#10<sup>8</sup>)

**“pseudo-experimental” data**  
Fewer Data  
(#10<sup>3</sup>-10<sup>4</sup>)

Which template is more similar to pseudo-exp?

□ Likelihood estimation

$$\mathcal{L} = \prod_{\text{bins}} P(r \mid \text{pseudo}, \text{template})$$

□  $\chi^2$  test

$$\chi^2 = \sum_{\text{bins}} \frac{(\text{pseudo} - \text{template})^2}{\text{pseudo}}$$

# If anisotropic distribution is realized

$E_{\text{thr}}=50\text{keV}$  (Ag)  
 $M_{\text{dm}}=300\text{GeV}$

- Required #event to exclude isotropic case are  
 $6 \times 10^3$  (ER-cos) /  $5 \times 10^3$  (cos only) for target F  
 $6 \times 10^4$  (ER-cos) /  $2 \times 10^4$  (cos only) for target Ag.

# Supposing $M_{\text{DM}}$ is known...

- Required event numbers:

$6 \times 10^3$  (ER-cos) /  $5 \times 10^3$  (cos only) for target F

^

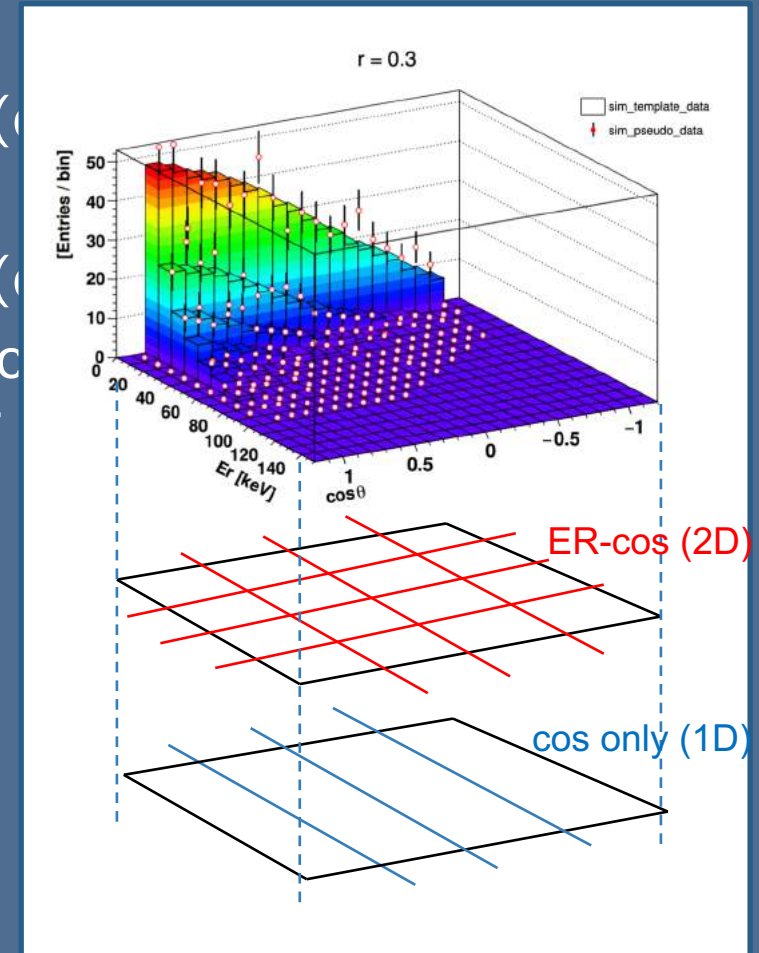

$6 \times 10^4$  (ER-cos) /  $2 \times 10^4$  (cos only) for target Ag

- For heavy target case, more event number is required than that for light target case.

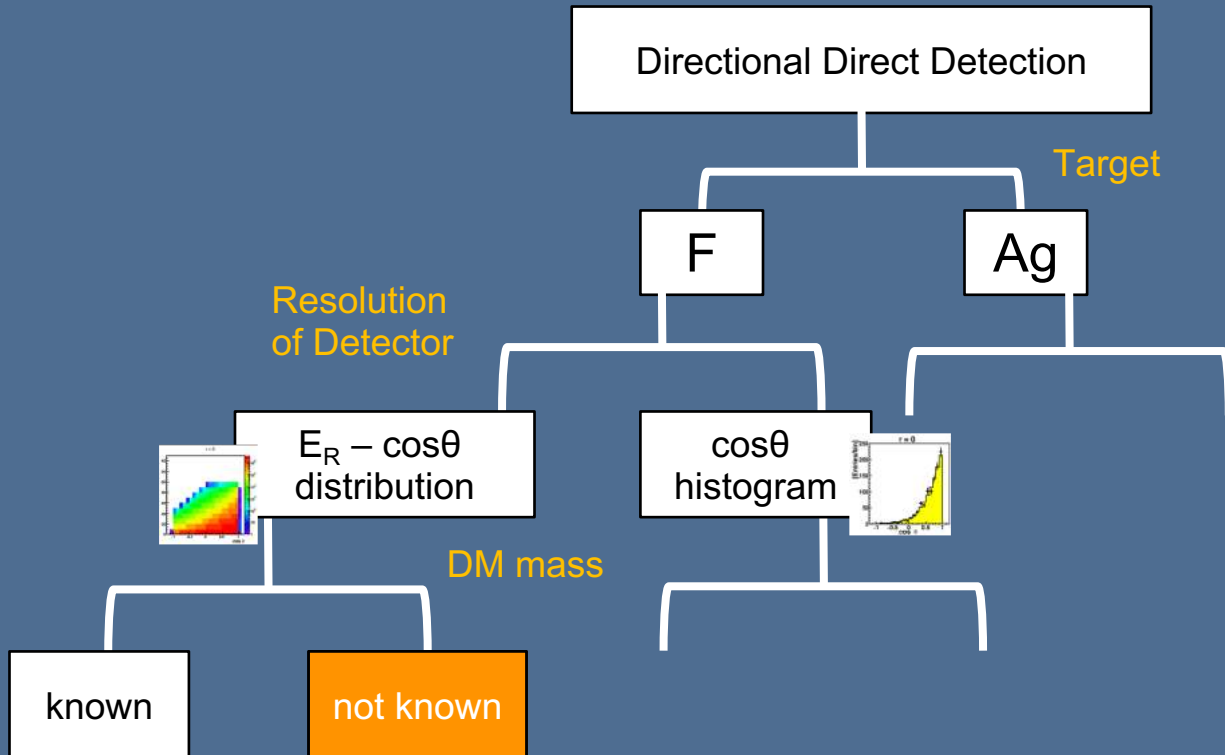

# $[E_R\text{-cos}]$ VS $[\text{cos only}]$

- Required event numbers:  
 $6 \times 10^3$  (ER-cos)  $>$   $5 \times 10^3$  (cos only)
- $6 \times 10^4$  (ER-cos)  $>$   $2 \times 10^4$  (cos only)
- For energy-angular distribution comparison, more data is required than that for angular distribution only.
- Event number for a bin is missed in 2D analysis (depending on #bin and  $E_r^{\text{thr}}$ ?).

# Cases

# What if $M_{DM}$ is not known?

□ Likelihood method

E<sub>thr</sub>=50keV (F)  
M<sub>dm</sub>=60GeV  
#event: 1000

□ Anisotropy is not discriminated only by E<sub>R</sub>.

□ Constraint for mass by directionality histogram is not so strictly.

# What if $M_{DM}$ is not known?

□ Likelihood method

E<sub>thr</sub>=50keV (F)  
 $M_{dm}$ =60GeV  
#event: 1000

preliminary

- We need both  $E_R$  and directional information to give constraint for both anisotropy and mass at the same time.

# What if $M_{DM}$ is not known? (Ag)

□ Likelihood method

$E_{thr}=50\text{keV}$  (Ag)  
 $M_{dm}=300\text{GeV}$   
#event: 10000

# Summary

- Possibility to figure out DM mass and anisotropy of DM distribution is discussed.
- If DM mass is known by other searches, we can discuss the anisotropy once  $O(10^3-10^4)$  event is obtained in directional detection.
- Even if  $M_{\text{DM}}$  is not known, once both  $E_R$  and angular information are obtained we can give constraints for  $M_{\text{DM}}$  and distribution.

Thank you for your attention.
